Document 1

... Nearness to the ocean and to navigable streams as well as local factors of site governed the location of the nucleuses [settlements] at and about which the initial footholds on the Atlantic seaboard were made. How well these elements were recognized by the colonizing agencies early determined success or failure. The James, Potomac, Delaware, Hudson, and Connecticut Rivers became the principal lines of penetration. In most of the English colonies settlers crossed the Fall Line shortly before 1700, set up forts and trading posts along this break in navigation, and entered both the Piedmont in the southern and middle colonies and the hill lands of New England and New York. Always the rivers were the spearheads of penetration. Traders and explorers crossed the mountain barriers to the west and learned of the headwaters of the Ohio; the Dutch and later the English followed the Hudson to and above Albany; the New Englanders advanced rapidly into the Connecticut Valley. Boston, New York, Philadelphia, and smaller settlements approaching urban size became centers of growth and commerce. By 1700 the total population in Colonial America was about 275,000. ...

Document 2A

Great Lakes Shipping

Document 2B

On May 29, 1890, the ship W. R. Stafford left Marquette, Michigan, on a routine voyage, carrying a load of iron ore to Ohio and returning with a load of coal.

... Thousands of times that year, hundreds of ships plying [sailing] the Great Lakes between the rich ore fields along the southern and western shores of Lake Superior and the industrial centers in Ohio and Michigan repeated her [the W. R. Stafford] schedule. The abundance and quality of the ore these ships transported helped fuel unprecedented industrial growth in the United States in the last decades of the 19th century. Great Lakes transportation played a critical role in that growth. Without this link, it is doubtful the growth of American industry could have occurred as rapidly as it did. . . .

Q: Based on Document 2A & B, identify 2 impacts the Great Lakes had on the industrialization of the United States

1. **Transportation Route for Raw Materials on Their Way to Manufacturers in East**

2. **Fueled Rapid Growth of American Industry**
The Ogallala Aquifer* (also known as the High Plains Aquifer) is now [in 2000] facing declining water levels and deteriorating water quality. More than 90% of the water pumped from the Ogallala irrigates at least one fifth of all U.S. cropland. This water accounts for 30% of all groundwater used for irrigation in America. Crops that benefit from the aquifer are cotton, corn, alfalfa, soybeans, and wheat. These crops provide the Midwest cattle operations with enormous amounts of feed and account for 40% of the feedlot beef output here in the U.S. Since the advancement of agricultural irrigation in the earlier part of the 20th century, the Ogallala has made it possible so that states such as Nebraska and Kansas can produce large quantities of grain required to feed livestock.

Without irrigation, the High Plains region would have remained a hostile and unproductive frontier environment. Even today dry-land farming remains high-risk farming about which the producers in the region have doubts. But while the Dust Bowl label is appropriate, the High Plains has become one of the most productive farming regions of the world. However, now as groundwater levels decline, workable alternatives for sustainable development have to be further explored.
